### Sprint Description:

In this sprint, we divided the tasks for frontend and backend, this allows us to have progress with both ends in our project. For frontend, we focused on development of core components of the application. On the other hand, on the backend, we focused on establishing the connection between the angular project and springboot server.

### **Sprint Retrospective:**

- What went well?
  - The team was cooperative and did their best to meet the deadlines.
  - We established the connection of springboot to our database.
  - We have now an initial registration that inserts the data of the user to the database.
- What could be improved?
  - For frontend, some pages like dashboards, categories, and budgets need interface improvement.
  - Refine the initial project timeline in Notion and task estimation.
- What needs to be done?
  - We will try to integrate the frontend sign-in and sign-up forms with our backend that inserts user data to the database next sprint.
  - Consider future revision and suggestions for improvement.
